

ICS 2022 Problem Sheet #9

Problem 9.1: JK flip-flops

JK flip-flops, also colloquially known as jump/kill flip-flops, augment the behaviour of SR flip-flops. The letters J and K were presumably picked by Eldred Nelson in a patent application.

The sequential digital circuit shown below shows the design of a JK flip-flop based on two SR NAND latches. Assume the circuit's output is $Q = 0$ and that the inputs are $J = 0$ and $K = 0$, and that the clock input is $C = 0$. (You can make use of the fact that we already know how an SR NAND latch behaves.)

- a) Suppose J transitions to 1 and C transitions to 1 soon after. Create a copy of the drawing and indicate for each line whether it carries a 0 or a 1.

- b) Some time later, C transitions back to 0 and soon after J transitions to 0 as well. Create another copy of the drawing and indicate for each line whether it carries a 0 or a 1

- c) Some time later, J and K both transition to 1 and C transitions to 1 soon after. Create another copy of the drawing and indicate for each line whether it carries a 0 or a 1.

- d) Finally, C transitions back to 0 and soon after J and K both transition to 0 as well. Create another copy of the drawing and indicate for each line whether it carries a 0 or a 1.

Problem 9.2: fold function duality theorems

The fold functions compute a value over a list (or some other type that is foldable) by applying an operator to the list elements and a neutral element. The `foldl` function assumes that the operator is left associative, the `foldr` function assumes that the operator is right associative. For example, the function application

```
foldl (+) 0 [3,5,2,1]
```

results in the computation of $((((0+3)+5)+2)+1)$ and the function application

```
foldr (+) 0 [3,5,2,1]
```

results in the computation of $(3+(5+(2+(1+0))))$. The value computed by the fold functions may be more complex than a simple scalar. It is very well possible to construct a new list as part of the fold. For example:

```

1  map' :: (a -> b) -> [a] -> [b]
2  map' f xs = foldr ((:) . f) [] xs

```

The evaluation of `map' succ [1,2,3]` results in the list `[2,3,4]`. There are several duality theorems that can be stated for fold functions. Prove the following three duality theorems:

a) Let `op` be an associative operation with `e` as the neutral element:

`op` is associative: $(x \text{ op } y) \text{ op } z = x \text{ op } (y \text{ op } z)$

`e` is neutral element: $e \text{ op } x = x$ and $x \text{ op } e = x$

Then the following holds for finite lists `xs`:

`foldr op e xs = foldl op e xs` `let xs = [1,2,3]`

$\Rightarrow (1 \text{ op } (2 \text{ op } (3 \text{ op } e))) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$

$(1 \text{ op } (2 \text{ op } (e \text{ op } 3))) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$ (`e` is neutral element)

$((1 \text{ op } (2 \text{ op } e) \text{ op } 3)) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$ (`op` is associative)

$((1 \text{ op } (e \text{ op } 2) \text{ op } 3)) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$ (`e` is neutral element)

$((((1 \text{ op } e) \text{ op } 2) \text{ op } 3)) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$ (`op` is associative)

$((((e \text{ op } 1) \text{ op } 2) \text{ op } 3)) = (((e \text{ op } 1) \text{ op } 2) \text{ op } 3)$ (`e` is neutral element)

\Rightarrow `foldr op e xs = foldl op e xs` holds for finite lists `xs`

b) Let `op1` and `op2` be two operations for which holds.

$x \text{ `op1` } (y \text{ `op2` } z) = (x \text{ `op1` } y) \text{ `op2` } z$
 $x \text{ `op1` } e = e \text{ `op2` } x$

Then the following holds for finite lists `xs`:

`foldr op1 e xs = foldl op2 e xs` `let xs = [1,2,3]`

$\Rightarrow (1 \text{ `op1` } (2 \text{ `op1` } (3 \text{ `op1` } e))) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$

$(1 \text{ `op1` } (2 \text{ `op1` } (e \text{ `op2` } 3))) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$ ($x \text{ `op1` } e = e \text{ `op2` } x$)

$((1 \text{ `op1` } (2 \text{ `op1` } e) \text{ `op2` } 3)) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$ ($x \text{ `op1` } (y \text{ `op2` } z) = (x \text{ `op1` } y) \text{ `op2` } z$)

$((1 \text{ `op1` } (e \text{ `op2` } 2) \text{ `op2` } 3)) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$ ($x \text{ `op1` } e = e \text{ `op2` } x$)

$((((1 \text{ `op1` } e) \text{ `op2` } 2) \text{ `op2` } 3)) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$ ($x \text{ `op1` } (y \text{ `op2` } z) = (x \text{ `op1` } y) \text{ `op2` } z$)

$((((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)) = (((e \text{ `op2` } 1) \text{ `op2` } 2) \text{ `op2` } 3)$ ($x \text{ `op1` } e = e \text{ `op2` } x$)

\Rightarrow `foldr op1 e xs = foldl op2 e xs` holds for finite lists `xs`

c) Let op be an associative operation and xs a finite list. (op is associative: $(x \text{ op } y) \text{ op } z = x \text{ op } (y \text{ op } z)$)

$$\text{foldr op a xs} = \text{foldl op' a (reverse xs)}$$

Then holds with

$$\underline{x \text{ op' } y = y \text{ op } x}$$

$$\text{foldr op a xs} = \text{foldl op' a (reverse xs)} \quad \text{let } xs = [1,2] \Rightarrow$$

$$\text{foldr op a [1,2]} = \text{foldl op' a [2,1]}$$

$$\Rightarrow (1 \text{ op } (2 \text{ op } a)) = ((a \text{ op' } 2) \text{ op' } 1)$$

$$((1 \text{ op } 2) \text{ op } a) = (a \text{ op' } (2 \text{ op' } 1))$$

$$\text{Which is true} \Leftrightarrow 1. 1 \text{ op } 2 = 2 \text{ op' } 1 = b \Rightarrow x \text{ op' } y = y \text{ op } x$$

$$2. b \text{ op } a = a \text{ op' } b \Rightarrow x \text{ op' } y = y \text{ op } x$$

Then this holds that if $\text{foldr op a xs} = \text{foldl op' a (reverse xs)}$ then it follows that $x \text{ op' } y = y \text{ op } x$.
